

Name:

**Math 3320 Midterm Exam #1 - February 10, 2005**

1. **(15 points)** Complete the following definitions:

- a. Let  $G$  and  $G'$  be two groups. A *homomorphism* from  $G$  to  $G'$  is...
- b. Let  $G$  and  $G'$  be two groups. An *isomorphism* from  $G$  to  $G'$  is...
- c. Let  $G$  be a group with  $g \in G$ . The *order* of  $g$  is...
- d. The symmetric group  $S_n$  is...
- e. Let  $G$  be a group with  $g \in G$ . The *cyclic subgroup generated by  $g$*  is...

2. **(16 points)** True or false:

- \_\_\_\_\_ a. Every group of order four is abelian.
- \_\_\_\_\_ b. Every group of order four is cyclic.
- \_\_\_\_\_ c. The odd permutations in  $S_n$  form a subgroup.
- \_\_\_\_\_ d. The intersection of two subgroups of a group is always a subgroup.
- \_\_\_\_\_ e. The union of two subgroups of a group is always a subgroup.
- \_\_\_\_\_ f. Let  $g, h, x \in G$ . If  $gx = xh$  then  $g = h$ .
- \_\_\_\_\_ g. Subtraction is associative.
- \_\_\_\_\_ h. A group has only one identity element.

3. **(16 points)** Determine whether the given binary structure is a group. If not give a group axiom that fails:

- a.  $U = \{z \in \mathbf{C} \mid |z| = 1\}$  under multiplication
- b.  $U = \{z \in \mathbf{C} \mid |z| \geq 1\}$  under multiplication.
- c.  $U_n = \{z \in \mathbf{C} \mid z^n = 1\}$  under multiplication.
- d.  $\{3^n \mid n \in \mathbf{Z}\}$  under addition.
- e.  $\{1, 3, 4, 5, 7\}$  under multiplication mod 8.

f.  $SL_n = \{n \times n \text{ matrices with determinant } 1\}$  under matrix multiplication.

g.  $H = \{\sigma \in S_7 \mid \sigma(1) = 1\}$ .

h.  $H = \{\sigma \in S_7 \mid \sigma(1) = 2\}$ .

4. **(20 points)** Let  $G$  be a group and let  $x, y \in G$ . We say  $x$  is *conjugate to*  $y$  if there exists some  $g \in G$  such that:  $gxg^{-1} = y$ . If  $x$  is conjugate to  $y$  then write  $x \sim y$ .

a. Show that the only element conjugate to  $e$  is  $e$ .

b. Show that if  $G$  is abelian and  $x \in G$  then the only element conjugate to  $x$  is  $x$ .

c. Give the properties of  $\sim$  needed for it to be an equivalence relation.

d. Prove that  $\sim$  is an equivalence relation on an arbitrary group  $G$ . (The equivalence classes are called *conjugacy classes*.)

5. **(12 points)**

a. What are the generators for the cyclic group  $Z_{18}$  under  $+_{18}$ ?

b. Give the complete subgroup lattice of  $Z_{18}$ .

6. **(15 points)** Let  $\phi : G \rightarrow G'$  be a group homomorphism. Define:

$$K = \{g \in G \mid \phi(g) = e\}.$$

i.e.  $K$  is all the elements that map to the identity under  $\phi$ .  $K$  is called the *kernel* of the homomorphism.

a. Prove that  $K$  is a subgroup of  $G$ .

b. Now suppose  $G = \mathbf{C}^*$ , the nonzero complex numbers under multiplication, and suppose  $G' = \mathbf{R}^+$ , the positive real numbers under multiplication. Recall the norm map:

$$\phi : \mathbf{C}^* \rightarrow \mathbf{R}^+$$

given by  $\phi(z) = |z|$ . Check that  $\phi$  is a homomorphism. Determine the kernel. Is it a subgroup of  $\mathbf{C}^*$ ?

7. (10 points) The multiplication table is given below for the *quaternion group*  $Q$ .

|    | 1  | -1 | i  | j  | k  | -i | -j | -k |
|----|----|----|----|----|----|----|----|----|
| 1  | 1  | -1 | i  | j  | k  | -i | -j | -k |
| -1 | -1 | 1  | -i | -j | -k | i  | j  | k  |
| i  | i  | -i | -1 | k  | -j | 1  | -k | j  |
| j  | j  | -j | -k | -1 | i  | k  | 1  | -i |
| k  | k  | -k | j  | -i | -1 | -j | i  | 1  |
| -i | -i | i  | 1  | -k | j  | -1 | k  | -j |
| -j | -j | j  | k  | 1  | -i | -k | -1 | i  |
| -k | -k | k  | -j | i  | 1  | j  | -i | -1 |

- Is  $Q$  abelian?
- Find the order of the elements  $-1$ ,  $i$ , and  $-k$ .
- Find the inverse of  $i$ .
- Find the subgroup generated by  $k$ .
- (Bonus) Give a reason why this group is not isomorphic to the dihedral group  $D_4$  (symmetries of a square).
